

Objectives

1. Create a system to monitor room usage intensity, primarily focusing on student kitchens.
2. The system needs to be cheap and easy to install and maintain.
3. The system should provide real-time information about room usage intensity.

System

- Hardware setup.
- Require one or several Microsoft Kinect cameras (one over each entrance).
- Require power....
- Require a computational device with internet connection...
- Portability.
- Cross platform. Support most UNIX-like systems and Windows.

Figure: Figure caption

Software

- Built in C++ but very modular, extendable and configurable.
- Modular
- Algorithms have a very clear general interface to the rest of the pipeline.
- Multiple algorithms of the same type could be developed in parallel with minimal interface compliance effort.
- An entire new computer vision approach could be switched to at the end of the project, entirely painless.
- Configurable
- The entire pipeline can be reconfigured in the config file, including and rearranging algorithms as well as specifying their parameters without recompiling.
- Possible to automate tests of hundreds of configurations, changing both algorithms and algorithm parameters.

Dense Debugger

- Transparent and flexible pipeline overview.
- Online low-level profiling for every module.
- Configuration interface
- Doors (green)
- Entering checkpoints (circles)
- Exclusions (red)

Figure

Image Processing

- Human segmentation.
- The human segmentation is based on the assumption that human heads are distinguishable modes in the depth image and that people moving very close to each other seldom differ much more than a head in height. The later assumption seem to hold more often than one might think, as supported by over 5 hours of test data. The segmentation is realized by a series of threshold and morphological operations, gaussian blurring, contour drawing and searches for local maxima's.

Figure: Occlusion handling

- Tracking and counting.
- The tracker pairs objects with each other from previous frame to the next. Pairs closest matching objects. Handles occlusion, outliers and noise.
- Counting is done using user specified checkpoint lines and a door area.
- Queue detection.
- detecting queues

(a) Newly found potential objects(red), lost object(blue) and an object(green)

Results: Table

- Final system performance

$$A_{in} = 1 - \left| \frac{\sum_{frames} in_{Est} - \sum_{frames} in_{GT}}{\sum_{frames} in_{GT}} \right| \tag{1}$$

$$A_{out} = 1 - \left| \frac{\sum_{frames} out_{Est} - \sum_{frames} out_{GT}}{\sum_{frames} out_{GT}} \right| \tag{2}$$

Sequence Name	Total entered (GT)	A_{in}	Total exited (GT)	A_{out}
Data seq. 1	108 (108) people	99 %	101 (104) people	97 %
Data seq. 2	122 (141) people	87 %	77 (91) people	85 %

Table: System performance in the two evaluation sequences

- Data seq. 1 & Data seq. 2 are two data sequences of 30 minutes each.

Conclusion

- The system provides high-precision people counting using the Microsoft Kinect sensors.
- The software architecture enables fast implementing and testing of different algorithms.
- SOMETHING MORE
